Explanation

The City-scale Liquefaction Hazard Map of Bacolod City was based on geology, presence of active faults, historical accounts of liquefaction, geomorphology and hydrology of the area. Field surveys conducted in 2017 verified outstanding geomorphic features in the field, identifying areas susceptible to liquefaction.

The presence of liquefaction hazard does not restrict construction of any structure and development. However, proper engineering consideration must be taken into account (e.g. strict adherence to the National Building Code of the Philippines.)

PHIVOLCS-DOST takes the necessary steps to continually improve the accuracy of the liquefaction information reflected in this map. The Liquefaction Hazard Map may be revised as new information becomes available.

Limitations

1. All hazard zone boundaries are approximate and gradational.
2. This map is semi-detailed and may be used only for land-use, emergency response and mitigation planning. Site specific evaluation is needed for construction of major structures and lifelines.
3. Administrative boundaries are approximate.
4. Coastal boundaries of the hazard are based on the latest location of the coast as shown in the most recent Google Satellite Imagery (2013-2017) available or IFSAR, Digital Terrain Model. The boundaries may change through time, as coasts are continuously subjected to processes that may contribute to their erosion or aggradation.

Data Sources

1. Base maps are National Mapping and Resource Information Authority (NAMRIA) 1:50,000 topographic maps, 1993 and IFSAR-Digital Terrain Model, 2013.
2. Administrative boundaries are adopted from Philippine GIS data, 2011.
